# Discom Emission Control Systems Rail

# Discom proposal

Wherever combustion engines are used to provide power, emissions are produced as well. We have made it our task to reduce these undesirable pollutants such as NO<sub>x</sub>, CO, PM and HC in a sustainable and effective manner while complying with increasingly strict global legislation. With more than 15 years of experience, we are your competent and reliable partner for proven and tested exhaust systems for combustion engines.

With innovative products, we offer you solutions for the efficient reduction of noise and pollutant emissions such as NO<sub>x</sub>, CO, PM and HC from diesel engines. We offer you extensive know-how and a broad product portfolio for locomotives and DMU's, both for retrofitting and new builds. With our comprehensive in-house engineering, we are happy to be your development partner for future emission control systems.

Especially when retrofitting exhaust silencers or after treatment systems on existing vehicles and machines, a one-to-one replacement is often not possible. Confined installation spaces, stricter technical or legislative requirements or simply increased space requirements are just a few of the difficulties that can arise during retrofitting.

In co-operation with our partner Discom will offer you the best possible solution. Discom BV is certified according to ISO 9001, EN 15085-2 CL 1 and ISO 3834-2.
